PROFESSIONAL SUMMARY

Frontend Engineer with 5+ years building production fintech across mobile and web, consumer cross-border remittance and B2B payroll at a Y Combinator (W22) company I joined before its YC acceptance. Specialized in TypeScript, React, React Native, and Next.js, with a focus on server-state management, transfer security, and the states money movement creates but users never see: pending settlement, out-of-order webhooks, expired FX rates, and partial batch failures. In a team of two frontend engineers covering three platforms and two products, I specced, built, reviewed, and maintained most of what I shipped. Available immediately.

CORE SKILLS

Languages: TypeScript, JavaScript (ES6+), HTML5, CSS3, SCSS/Sass

Frameworks & Libraries: React.js, Next.js (App & Pages Router), React Native, Node.js

State & Styling: TanStack Query, Zustand, Tailwind CSS, ShadCN/UI, NativeWind, Styled Components

Mobile: React Native, NativeWind, Xcode, Android Studio (iOS & Android)

Backend & Data: Supabase, PocketBase, PostgreSQL, REST APIs, Webhooks

DevOps & Deployment: Azure, Vercel, Netlify, GitHub Actions, CI/CD, Docker, VPS

Tooling & Practices: Git, Bitbucket, ESLint, Prettier, Figma, Postman, Jira, Agile/Scrum

AI-Assisted Development: Claude Code, Cursor, Codex — agentic workflows for refactoring and delivery, with review standards unchanged

PROFESSIONAL EXPERIENCE

Frontend Developer (Software Engineer)

Transfez (YC W22) / Jack Finance — Jakarta, Indonesia (Remote)

Jan 2021 – Sept 2026

Transfez Group — backed by Y Combinator (W22) and MUFG Innovation Partners — operates consumer (Transfez) and B2B (Jack) fintech products. The Bank Indonesia-licensed B2B arm serves 600+ businesses across 140+ banks & e-wallets and 70+ destination countries.

- Joined as an early engineer before the company's YC W22 acceptance, architecting the cross-platform consumer transfer product (React Native + Next.js) across iOS, Android, and web from a single source of truth.
- Built the consumer transfer security layer — PIN entry with state machine, crypto-hashed submission, fingerprint authentication, and OTP with timer/resend — shipped across the Malaysia→Indonesia and Singapore→Indonesia corridors.
- Built the frontend for a B2B international transfer product covering 70+ destination countries, each with its own recipient form schema and validation rules, plus real-time FX rates and multi-method payments.
- Engineered bulk transfer and payroll disbursement: CSV/Excel uploads rendered as paginated tables of up to 1,000 rows, with per-row and bulk validation, real-time status polling, and partial-failure recovery so one bad row doesn't sink the batch.
- Rebuilt server-state handling on TanStack Query — cache invalidation, retry policy, and optimistic updates that roll back cleanly when a bank rejects. Cut redundant API calls by ~60% and removed a class of stale-balance bugs caused by ad-hoc refetching.
- Owned the client side of banking integrations: normalized inconsistent error shapes into actionable user states, handled out-of-order webhook status updates, and made slow bank responses degrade a single screen instead of freezing the app.
- Established the internal UI component libraries (ShadCN/UI + Tailwind CSS, NativeWind) and the CSS architecture underneath them, standardising design patterns across all products.
- Owned frontend architecture for the B2B product, from state-management strategy to Azure and Netlify CI/CD pipelines; cross-product decisions were reviewed with the senior frontend engineer.

- Became the go-to engineer for 2–3 developers who regularly sought help debugging and solving problems in their own work, and optimised Web Vitals and mobile render cycles against legacy banking infrastructure we neither control nor can change.

General Affairs Staff

BNI Syariah — Jakarta, Indonesia

May 2018 – Feb 2020

- Led and coordinated a team of non-staff personnel (office boys, drivers, security) for the head office — owning scheduling, overtime, and daily operations while enforcing discipline and clear standards across the unit.
- Handled general affairs and logistics: processed payment vouchers, managed office procurement, and negotiated facilities with the building owner (leased premises), before transitioning into software engineering.

FEATURED PROJECT

Architecture Firm ERP — *Solo full-stack build, live in production*

Designed and shipped a complete internal ERP single-handedly for an architecture firm — from database to UI — now running in production. Covers multi-division project tracking (architecture, civil, interior), client management, an A4 quotation & invoice editor with QR verification, role-based dashboards with Gantt charts, and financial reporting with PDF export, all on a custom RBAC system with granular per-role permissions.

React 19, TypeScript, PocketBase, TanStack Query, Tailwind CSS 4

EDUCATION

Universitas Gunadarma — Bachelor of Computer Science, Information Systems

2013 – 2017 · GPA 3.34

Hacktiv8 Indonesia — Fullstack JavaScript Immersive

Feb 2020 – Jul 2020

Intensive bootcamp covering the modern JavaScript ecosystem (React.js, Node.js, Express, PostgreSQL); built multiple full-stack applications from scratch.

ADDITIONAL

- **Languages:** Indonesian (Native), English (Professional Working Proficiency)
- **Work Style:** 5+ years remote-first in current role — async collaboration, self-management, cross-timezone delivery
